

LED PRIMARY LIGHTS

LED6600C WITH GOODMAN HANDLE

Sartek's LED6600 series (canister system) and the EBL6600 (handheld flashlight) are more than powerful enough to be used as primary and video lights. The LED6600 @660 Lumens is brighter than even the latest 10 watt HIDs. These systems utilize the highest intensity/watt LED light sources available. The LED6600 can be connected to a 3 "C" cell canister (photo above) or configured as EBL6600C or EBL6600D flashlights (photos below). They all produce an intense white light that will last 3-4 hours at full output and well over 24 hours at reduced output and on just 3 "C" cell alkaline batteries. This cool white beam (6000 degrees K) is available with 3 different optics, a tight focused spot, a 25 degree video/photo optic and a 45 degree macro optic.

EBL6600C

The LED/EBL 6600 will continue to produce useable light for days even when the batteries are nearly fully discharged. The LEDs have a life expectancy of up to 100,000 hours illuminated. The LED6600 is also available as an upgrade conversion to your existing lighting/battery system.

LED1500 WITH GOODMAN HANDLE and MINI CANISTER

The Sartek LED1500 is the latest addition to the Sartek family of lights. The LED1500 puts out a blazing 1500 lumens of white light with a 7 degree beam. The LED1500 is actually made up of individually regulated LED assemblies. This means that the system has built in redundancy, each light is independently powered and regulated. The LED1500 is brighter than a 24 watt HID and like all Sartek LED systems, it will continue to produce usable light for many hours past its' expected burn time. The light pattern is an even tight spot, that will punch through even the most turbid water. The LED1500 is available with a range of 4V battery systems and capacities and can be used with Alkaline, NIMH and Lithium cells.

EBL6600D

Options include: Helmet mount, Goodman Handle Kit (includes both rigid and soft handles), Video Arm mount, D cell canister (5-6 hours), rechargeable Lithium Ion and NiMH Canister systems (with full light output capacities from 2 hours to over 36 hours).
